

Software Archaeology –  
Two Tales of hacking 90s  
MS-DOS Software

Alon Livne & Matan Mansheroff

# Who We Are

**ALON LIVNE**

CTO And Co-founder

**MATAN MANSHEROFF**

Senior Software Expert

# Who We Do It For?

- Israeli start-up companies
- Microsoft
- Other such small companies

# What We Do

- Deep tech consultation/development
- Vulnerability, firmware, embedded and other kinds of binary research
- Deep security reviews/audits
- Firmware and embedded research,
- CTFs

# Agenda

- “Software Archeology” ... ?
- Our “dig-sites” – *Kibbutz Dvir* and *New Jersey*
- Reverse engineering mid 90’s software
- Who cares anyway?
- Case studies – “QText” and “SAGA”

# Motivations and Focus

What is to be gained, seen or learned?

- Our thought process
- Unpackers, obfuscators, emulators and old software
- Methodology
  - Reverse Engineering
  - Debugging and tracing
  - Web archeology
- Preservation of knowledge
- Have fun!

# Getting our bearings

- It's the early 90s
- GUI is emerging
- ARPANET is still a thing
- BBSs are all the rage
- At the time – 8086 is king
- Our playing-field: MS-DOS

# MS-DOS - Overview

- “Disk operating system”
- Command-driven
- Some OS-ish functions
- Dead simple in all respects
- Business applications, games, etc

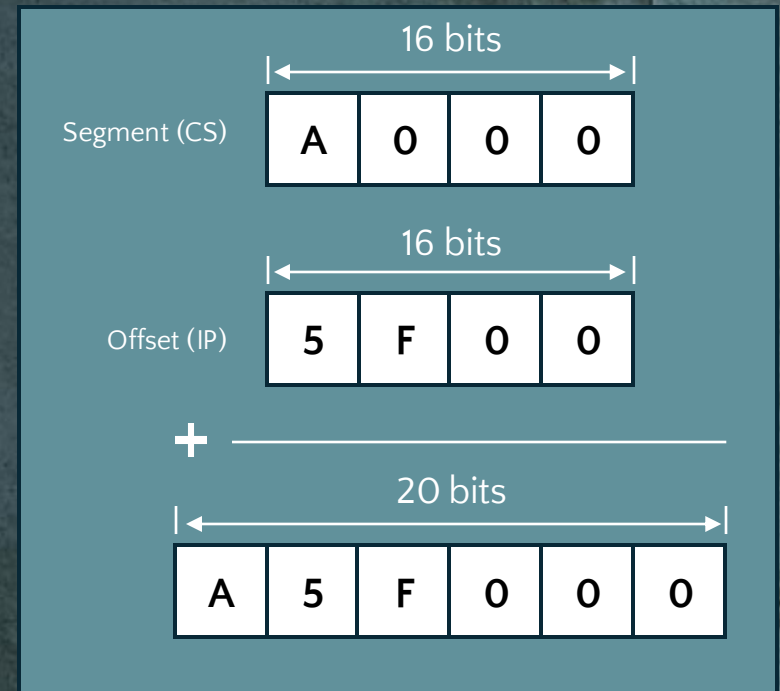

```
Starting MS-DOS...
```

```
C:\>_
```

# 8086 – Real vs Protected Mode

## Real Mode vs Protected Mode

	Protected Mode (16/32-bit)	Real Mode (16-bit)	Feature
	Flat + Segments (32-bit) 4 GB (32-bit)	Segment:Offset (20-bit) 1 MB max	Addressing
	Up to 4 GB	640KB app (≈ 1 MB)	Memory Limit
	Rings 0–3 (user/kernel)	None (Ring 0 only)	Privilege Levels (Rings)
	✓ MMU + Paging (virtual memory)	No MMU	Virtual Memory (Paging)
	Protected segments (+ descriptors)	Simple segments (no protection)	Segmentation
	IDT + Privileges	BIOS/DOS (INT 21h)	Interrupts

# Case #1 – QText

- Client (IL) approaches us
- A trove of password-protected documents, credentials to which have been lost
- Created using QText, the first Hebrew word processor – from Dvir Software

Our mission – *Decipher the documents!*

# Deep Dive – QText – Demo

# Jumping in

- We have a sample of an encrypted document
- Keyspace – 4 characters, limited
- Encryption adds a single line, 0x1D header to the program

```
[→ qtext head -n1 ABC2.TXT | xxd
00000000: ff20 ff20 ff20 ff20 ff20 3030 2070 32e4  . . . . . 00 p2.
00000010: 2cb4 dc26 d0a0 a050 7080 4030 320d 0a  ,..&...Pp.@02..
[→ qtext head -n1 SPACE.TXT | xxd
00000000: ff20 ff20 ff20 ff20 ff20 3030 20db 5cc6  . . . . . 00 .\.
00000010: 3223 342c 6497 9062 28c1 3042 840d 0a  2#4,d..b(.0B...
```

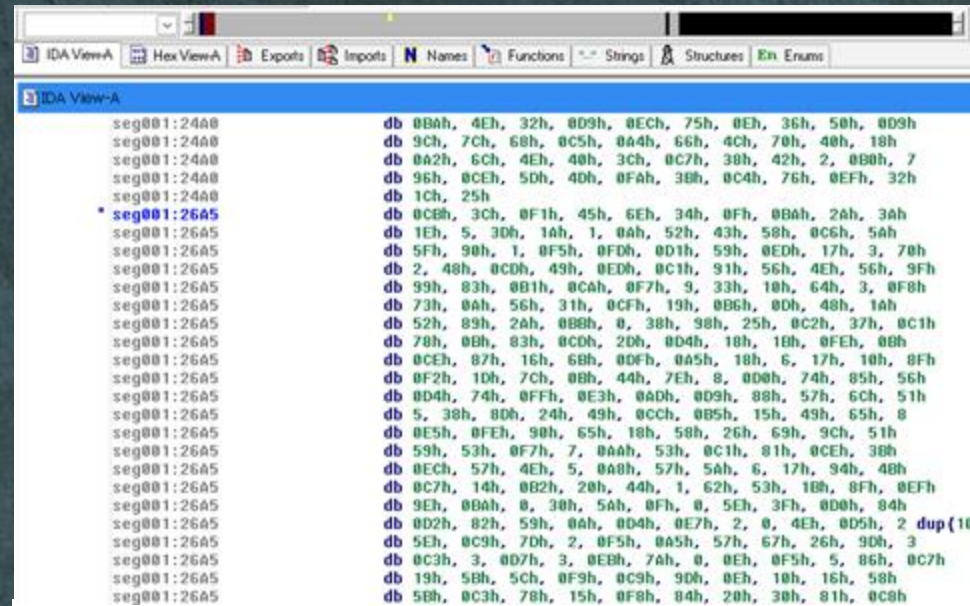

- Brute-force should be easy
- How to execute a brute-force attack? And is there a better solution?

# MS-DOS – static RE

- Is modern tooling good for this?
- Short answer – yes
- Long answer – NOOOOOOOOOOO
- Fortunately – we are not alone in our use cases – ScummVM to the rescue with IDA Free 5.0

# QText binary

Dear Beverly, Let me tell you I love you.

If you have new stuff (packers, protectors, unpackers and other tools) release, or good programs and old exe-collection want share for everybody, you can upload these archives directly to [the FTP server](#) with FTP service.

If you want to put your files to the FTP, you can opening [the FTP window](#), then dragging your files into it.  
I'd rather you packed all files with ZIP or RAR format before uploading them to the server.  
Please put a description file (e.g. file.txt or readme.txt) to your directory.

FTP server: 202.93.180.60  
User ID: exe-tools  
Password: exetool  
Port: 21

Thank you for your continued support and uploads.  
**ATTENTION!** Please use AVP to scan downloaded files.

## DISLITE v1.15

## PKUNLITE v3.00

**What's New?**

[ 07.12.2001 ]  
added protector: [tBlock v0.85f](#)

[ 07.11.2001 ]  
added protector: [Krypton The Krypter v0.3](#)

[ 06.29.2001 ]  
added protector: [Armadillo 2.01](#)

[ 06.28.2001 ]  
added debugger: [WKT-VBDebugger v1.2b](#) (p-code debugger)  
fixed BORLAND.INTERBASE.V6-ZENITH, please visit my FTP.

[ 06.27.2001 ]  
added compressor: [PECompact v1.50](#)

[ 06.26.2001 ]  
added BORLAND.INTERBASE.V6-ZENITH, please visit my FTP.

[ 06.25.2001 ]  
added protector: [Armadillo 2.01 Beta 1](#)  
added unpacker: [ArmKiller 1.3 CopyMem Edition](#) - Universal Unpacker for Armadillo 1.7x-2.0

Saga Case Management  
Need help reverse engineering this law firm case management software developed in 1999 using DOS. I own the software but it will not recognize a date past 12/21/25.

[-] webjockey 12 points 11 months ago  
Yikes.  
Saga was acquired by Client Profiles, who were then acquired by Aderant Holdings, who then launched their own replacement called Expert Case, essentially they just bought their competition.  
Good luck?

I ran into a DOS machine about 10 yrs ago, running on a 386 beige-box. It was used to control some scales that weighed oil-tubs of industrial paint.  
This was for a £30m company.  
[-] gwerldeth 1 point 11 months ago  
Yo.  
Client using DOS6 app in a Windows XP VM (to hide from network scanner looking for outdated machines) to download (FTP) updated financial data which produces some shitty output. Since he can't save to anything but a Borland Database he takes screen shots, sends to his secretary who has to manually re-type all of the data.  
They think it's perfectly normal.

DOS?? (self.msp)  
submitted 11 months ago by LymGeekNYC  
I got a potential law firm client that still uses DOS as a case management system. Specifically SAGA Case Management system. I'm in shock. Who else runs it?

## There is a New Practice Manager for Personal Injury Firms in New York

Michael Zucchi  
Published Oct 22, 2014

Good news for NY PI firms, there is now another choice to upgrade from SAGA.

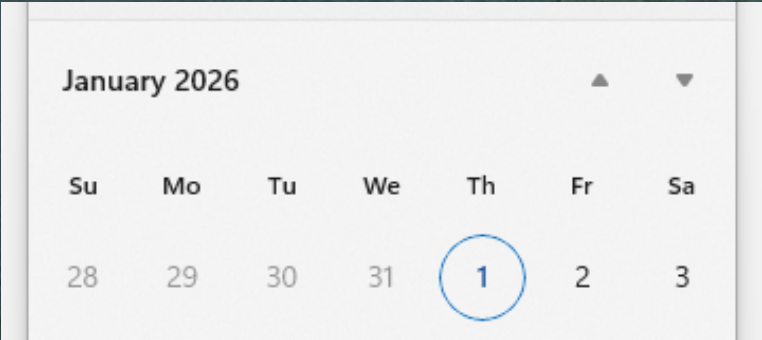

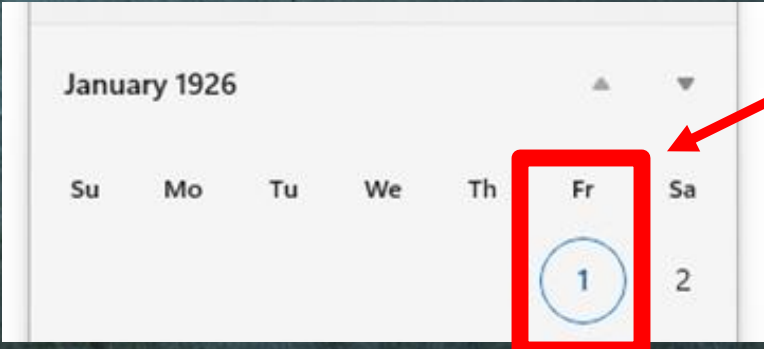

# Saga Case Management.

# Y2K Bug

Looking for someone that can modify the program to recognize dates 01/01/26 and beyond.

From Date: 01/01/26 Friday

# Y2K Bug

1998 February

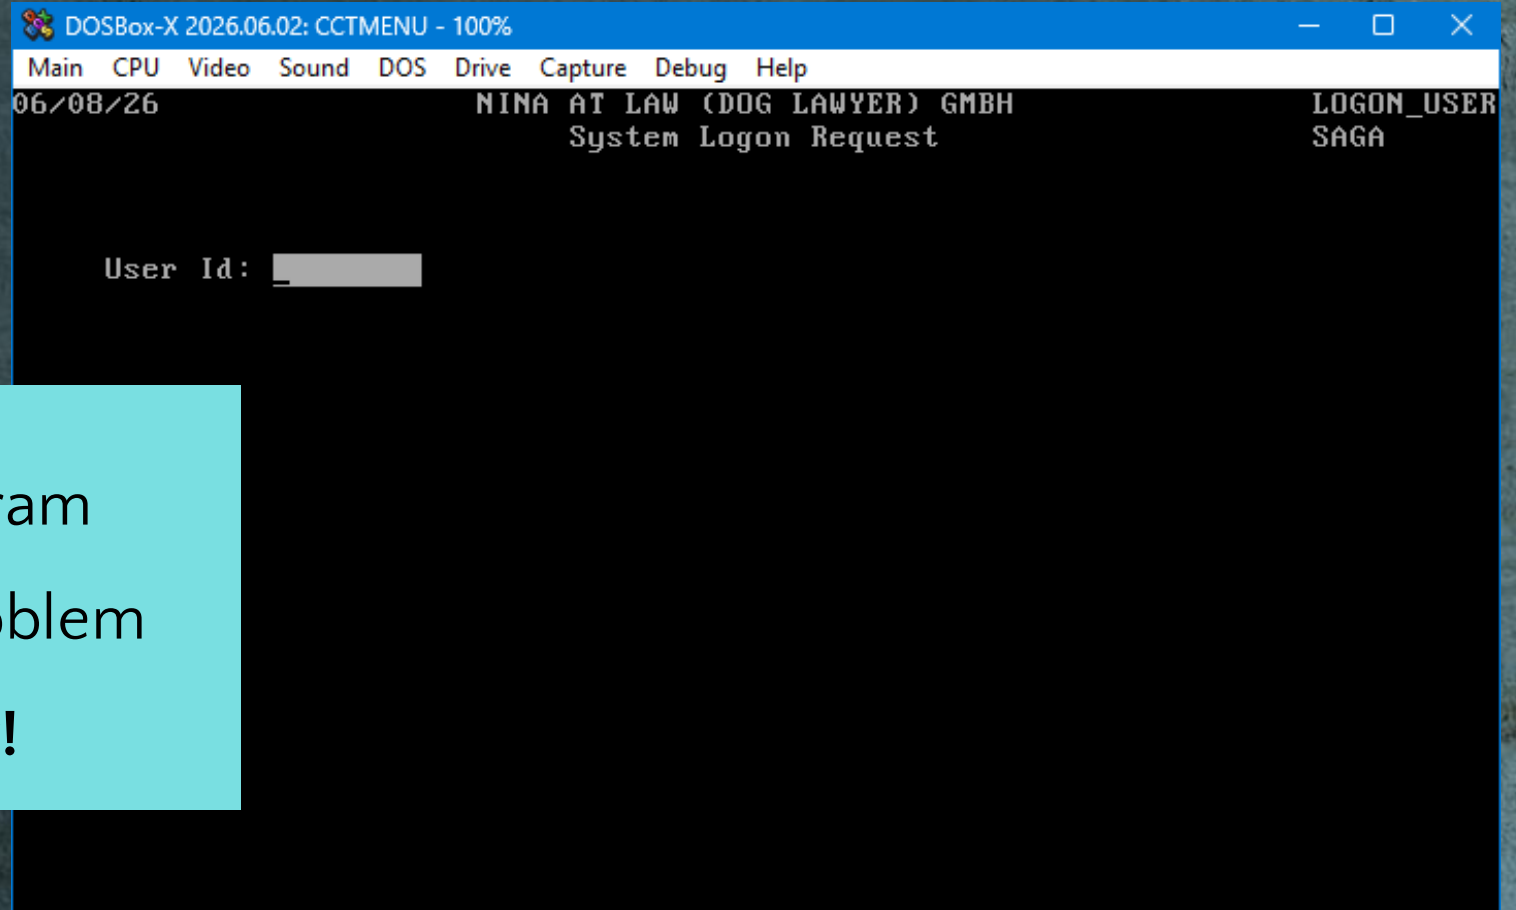

## The Year 2000 and 2-Digit Dates: A Guide for Planning and Implementation

People prepared to **"bug out"**  
A mobile home; a year's supply of canned food; a propane generator — those were just some of the precautionary purchases California computer programmer Scott Olmstead made in advance of 2000. (He also said he was shopping for a handgun.)

# SAGA - Kicking off

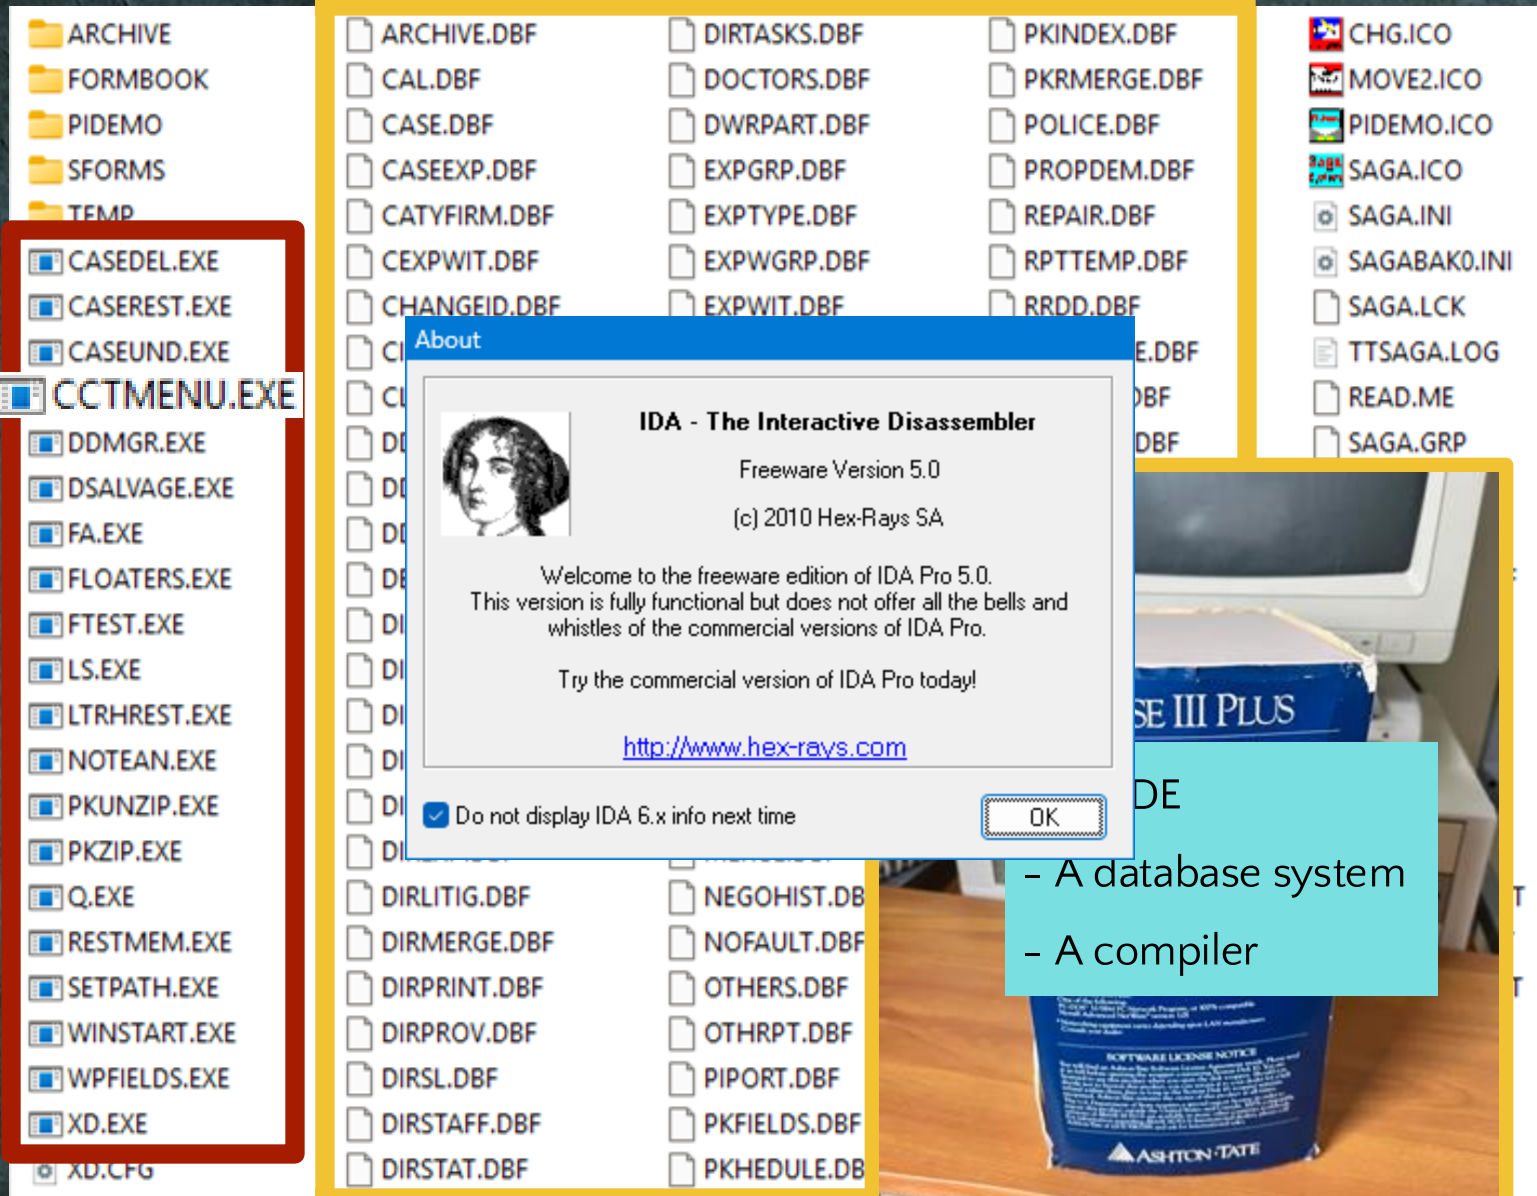

The screenshot shows a DOSBox-X window titled "DOSBox-X 2026.06.02: CCTMENU - 100%". The window has a menu bar with "Main", "CPU", "Video", "Sound", "DOS", "Drive", "Capture", "Debug", and "Help". The main display area shows the following text:

```
06/08/26                NINA AT LAW (DOG LAWYER) GMBH                LOGON_USER
                        System Logon Request                SAGA
```

Below the text, there is a prompt "User Id:" followed by a greyed-out input field.

- Got to know the program
- Demonstrated the problem
- **Let's start researching!**

# DOS Extenders

- DOS stub → switch into protected mode → run protected-mode program
- Protected mode enables
  - More usable memory (640 KB → 4 GB on 386+ CPUs)
  - Natural use of newer, 32-bit CPUs ( $\geq 386$ )
  - Flat 32-bit memory addressing
- Examples: DOS/4GW, CWSDPMI, Phar Lap...
- Used in games, CAD, database applications

*Jazz Jackrabbit (1994) is built with DOS/4GW*

# CauseWay DOS Extender

- Stub is linked into the final EXE, runs embedded executable
- Supports running in both 16- and 32-bit protected mode
- Supports very large memory models (>80386SX)
- Compatible with VCPI / DPMI
- Makes full use of 386-level chip capabilities
- Tooling included -
  - Linker (WarpLink)
  - Debugger (CWD)
  - Support & enhancement utilities

Compiling and running hello world program

From Wikipedia, the free encyclopedia

- xBase compiler
- Created in 1985 as a replacement for dBASE III
- Usage of Clipper declined in the early 90's
- Newer implementations actively developed to this day!

## Date & Time

<a href="#">SET CENTURY</a>	Modify the date format to include or omit century digits
<a href="#">SET DATE</a>	Set the date format for input and display
<a href="#">SET EPOCH</a>	Control the interpretation of dates with no century digits

## Set()

Posted on January 19, 2014 by vivaclipper

### Set()

*Changes or evaluated environmental settings*

### Syntax

```
Set(<nSet> [, <xNewSetting> [, <xOption> ] ] ) --> xPreviousSetting
```

### Arguments

<nSet> Set Number

<xNewSetting> Any expression to assign a value to the setting

<xOption> Logical expression

<nSet> <xNewSetting> <xOption>

### \_SET\_EPOCH <nYear>

Determines how to handle the conversion of 2-digit years to 4 digit years. When a 2-digit year is greater than or equal to the year part of the epoch, the century part of the epoch is added to the year. When a 2-digit year is less than the year part of the epoch, the century part of the epoch is incremented and added to the year. The default epoch is 1900, which converts all 2-digit years to 19xx. Example: If the epoch is set to 1950, 2-digit years in the range from 50 to 99 get converted to 19xx and 2-digit years in the range 00 to 49 get converted to 20xx.

Let's search 0x786 (1926) in binary, see what we find:
